A: You can use PS2 HDD USB Network Adapter. There is an application on your computer that can format a USB drive, but since it is a network adapter, it doesn't matter where you plug it in. Plug it in, start it, and follow the onscreen instructions. You can format it to FAT32 on Windows, and with the default settings, the USB port on your computer will be formatted to NTFS, which is what the PS2 needs to write to. You may have to format it from the drive itself, however, depending on how the adapter is partitioned.

WASHINGTON—As tensions surrounding North Korea's nuclear weapons programs increase, the Pentagon is again considering the use of military force to avert a nuclear catastrophe and is reviewing how to counter a potential new kind of missile that could hit American soil. The Pentagon and U.S. intelligence agencies estimate that North Korea has developed a small arsenal of bombs that could reach the U.S. mainland with a nuclear-tipped missile, a fact President Donald Trump has said he would use as a bargaining chip against the North if it doesn't agree to halt its missile and nuclear programs. The U.S. is looking at three potential types of weapons that could be used in such a scenario: a single-warhead, submarine-launched nuclear-tipped missile; a special, ground-launched cruise missile; and an air-launched cruise missile with a new kind of warhead. The “multiple independently targetable reentry vehicle” weapons have been the Pentagon’s focus for months, a senior U.S. defense official said. These are smaller versions of the solid-fueled missiles North Korea has tested that are designed to be fired from submarines. One, for example, can be attached to the nose cone of a submarine-launched ballistic missile and ejected after reaching its target. The Pentagon plans to deliver an initial classified briefing on the review to Congress, which has an obligation to be informed of any action the White House or military is considering regarding North Korea’s weapons, the official said. The military’s plan to review “carriage of nuclear weapons by ballistic missiles” was first reported by The Wall Street Journal on Thursday. Since last week, North Korea has resumed activity at its main nuclear complex and conducted what it described as a successful test of a submarine-launched ballistic missile 2d92ce491b
