Q: Printing output of a JTextField to display on the screen Is there a way to output the value of a JTextField that is input from the user directly to the screen (instead of being written to a file)? For example, if I set a text field to "Hello World" and then print it the console will show "World" but I want it to show "Hello World". Is there a way to accomplish this? Port Checker Review: The Port Checker application is suitable for verifying a particular port is opened or not, and also for checking if the port is not opened, in case the port in question is probably closed. It is in an executable file with no installation required, so it is extremely easy to use. Apart from the fact that the only feature of this utility is to check a port's availability, we can say that it performs that task very well. The application is very small in size (3.5MB), which is a good news, considering the fact that it checks a number of ports to check if they are closed or not. If the port in question is opened, then the result is shown in red, but if it is closed, the result will be shown in green. It is also worth mentioning that you can choose between checking the port's status and port's owner, to find out if the port in question is public or not. Port Checker will run with minimum CPU and RAM usage. There are no other features apart from port checker, and no settings can be changed. You can move the application to another drive (even the USB flash drive you are using) at any time by simply dragging it to your Desktop. The application comes with no warnings or error messages when you launch it.

Port Checker 8.78 Overall Score Port Checker is a small utility that offers a basic set of features, but it can be used by anyone without prior experience to verify that a given port is either open or closed. Port Checker was reviewed by Bogdan Popa, last updated on August 4th, 2013
