Photoshop 2022 (Version 23.1.1) [Mac/Win] [March-2022]

Tip The name "layer" for a Photoshop image is the same word as a layer in a drawing. Photoshop and other programs call the individual image layers "images" to distinguish them from the layers of a drawing. # Chapter 2. Getting Organized Examine the special needs of each type of image file you may encounter and how to maximize the features of a particular program. In addition, I show how you can use programs to manage your files, organize them with folders and subfolders, merge groups of images, copy and move files, and export images as a different file format. ## Need and Want: Determining What to Keep and What to Throw Away Each type of file has different attributes. Some types of files may be safe to toss or throw away, but others are critical to your project. Fortunately, you can manage your image-manipulation files in a number of ways to make sure you get the most out of them. This chapter presents a series of methodologies that enable you to sort and identify files by type.

A team of researchers led by UC Riverside's Peacock Center for Computational Ecology have identified the first known penguin species to survive above the Arctic Circle. The scientists estimate that the newly discovered emperor penguin population is now as large as or larger than previously documented populations in the Antarctic and sub-Antarctic and that the birds likely use the Arctic Circle as a migratory stopover on their journey south. The findings are published in the journal *Biology Letters*. "These birds can be tracked because the emperor penguin is the only penguin species that breeds during the winter and lays an egg while on the ice," said Peacock Center Director Melting Brine, lead author of the paper. "When the chicks hatch and the parents leave, the mothers return to molt. And they take all the feathers off their entire body in one go." On the Arctic Circle, between the 75th and 84th degrees of latitude, the researchers collected about 200 feathers from 36 nests of emperor penguins, and matched their unique bar codes to the latest estimates of emperor penguin population. The researchers used an algorithm based on the genetic makeup of a population to calculate the number of nests from which the feathers were collected. The team reports that 16 of the 36 nests were located within the Arctic Circle. Because the researchers did not sample the nests within the Arctic Circle, it is possible that the number of nests they found there greatly exceeds the current estimate. The researchers used census data from Antarctica and sub-Antarctic islands to estimate that emperor penguin populations in the Arctic Circle and above might be as large as the number of emperor penguins in the entire Antarctic and sub-Antarctic regions. "Such a large Arctic population is unprecedented, and suggests that during the Antarctic winters, emperor penguins migrate in vast numbers to the Arctic Circle," said Dr. Brine. "They have been breeding on the Arctic Circle for the last three decades, and have been gradually expanding their range northward. We are seeing these birds in increasingly northern environments. It's possible that they've even set up a population in Iceland." Emperor penguins swim and waddle much like flightless birds do, the researchers say. This makes their discovery at such high latitudes all the more unexpected. But emperor penguins at the top of the world face additional challenges. At the top of the planet, during the winter, winds, waves and pack ice make it very dangerous for
