I am going to have a java application running on a server. What I want is that I can just put the jar files in the /lib folder and the application would run on it without changes or on restart. I would like to use hibernate for this. Question: Will the hibernate automatically update itself in the database when the server is restarted, or do I have to do it manually? Please let me know! Thanks! A: Yes, the native persistence layer of hibernate (using a Java database) will take care of that for you. Conventionally, battery management systems are designed to operate in a closed loop with primary feedback, without employing a secondary or tertiary feedback loop. For example, a tripping circuit typically connects the battery to a battery charger for an interruption of battery charge current when a predetermined full state of the battery is reached. Typically, the tripping circuit is designed to interrupt the charge current of the battery when a current level of the battery reaches a predetermined threshold. For such a battery management system, a method and apparatus for monitoring battery voltage in a power supply system with battery failure utilizing a tripping circuit is provided. The battery is connected to a power supply system with an initial voltage applied to the battery. A voltage monitor is coupled to the battery. The voltage monitor monitors the battery voltage and generates a voltage signal indicative of the
