I have created a demo app to work as a light bluetooth mesh for my mesh networking device, which is working fine in my local pc and in mobile. But when i publish the app as a.aab file, my test user's machine gives the following error: Error The method `getRootDeviceInstallParams()` is undefined for the type `BluetoothMeshApp` I followed what's suggested here. And also i went through a lot of other threads which suggested to implement this function, but all are referring to the same implementation, which i've already implemented. I am implementing this part of code private

```
boolean requestRootDeviceInstall(String deviceName) { if
(mBluetoothManager.getBluetoothAdapter().getRemoteDevice(deviceName)!= null) { BluetoothDevice device =
mBluetoothManager.getBluetoothAdapter().getRemoteDevice(deviceName); Log.d(TAG, "Created already device " + device);
return true; } mContext.sendBroadcast(new Intent(ACTION_ROOT_DEVICE_INSTALL)); return false; }
```

A: So i found a solution myself. I just removed the code in `requestRootDeviceInstall()` method and the app worked fine. This was working fine in my android project as it's a native android app. But when i created a.aab file and tried installing it on my test user's machine, it gave me this error. Q: javascript "window.onload" function I'm using a javascript file that loads up some content into the background. My question is, how can I know when this content is loaded? In other words, I would like to know the status of the loading of the content. A: If you are using a common, static html page, you can put a loading div in it and in the document onload event remove it. [77a5ca646e](#)

Tagged Image File Format (TIFF) is one of the most widely used file formats in the world. It's used in numerous applications, ranging from scientific to commercial ones. It is also used as a format for printing. TIFF documents are generally multi-page images that are stored in a single file. They can also be split into individual single-page TIFF images. Multiff is a great tool for this purpose. It can help you split multiple TIFF images into single-page images and in the process create an output file in various formats, depending on your requirements. Multiff will also allow you to remove a page from the file, to change the order of the pages, or even add an image. All these features help you with managing large volumes of documents that are not always organized properly. Multiff is compatible with Windows, MAC, Linux and Unix-based operating systems, so it is available for many platforms. Multiff Review Compatible with Linux While Multiff is available for Linux, we are not sure if it is compatible with Mac OS. Convert TIFF into JPG The output format can be selected for your file.
