Like all computer programs, CAD is based on an algorithm. The algorithms in AutoCAD's drawing tools consist of commands that contain statements that perform a function on a block of selected data. In AutoCAD, the blocks of data are called drawings. A block may consist of one or more components that describe an object, such as a line, circle, point, polyline, text, dimension, and text annotation. The block defines the components that make up the drawing and the order in which they appear. In order to make drawings, the user selects blocks from a tool palette and performs the commands that make up the drawing algorithm. The user may also create new blocks or delete blocks from the drawing. A block is a container for data. A block may contain other blocks. Blocks may be nested, so a block can contain one or more other blocks. AutoCAD's drawing tools allow the user to construct drawings by combining blocks in various ways, including merging and nesting. AutoCAD is the world's most widely used 2D CAD application. Some of the prominent features of AutoCAD: Nav

Here, the trial court, while holding that the plaintiff had the right to be heard in opposition to the magistrate's finding, nevertheless proceeded to hear his case. The plaintiff did not ask for a new hearing. Under these circumstances, it would seem that the trial court should have disposed of the matter in accordance with the above holdings. Moreover, the trial court here, as a result of his findings, ordered the administrator to distribute all of the decedent's estate, in accordance with the public administrator's report, to the next of kin. Section 1102 of our Probate Code provides in part as follows: "After the hearing, if the court approves the *442 finding, the court shall order the distribution of the property of the deceased, in the following order of preference, so far as the same may be capable of distribution, as follows: "1.
