Although the name of Photoshop itself is a verb, many people have taken to misusing the term as if it were a noun, as in, "Oh, I photoshopped that picture." Don't use this synonym. It makes you look like a jerk. You can use Photoshop to manipulate images made in other software packages, but they need to be in the same file format — the so-called native format — as Photoshop. For example, if you made a JPEG file, you can open that file in Photoshop to get an image, but if you want to open an existing RAW file, you need a conversion program. To be specific, you need a program designed to open RAW files that is compatible with the Adobe Camera Raw (ACR) plug-in. Likewise, if you use Bridge to edit a JPEG, you want to use a program that's compatible with the ACR plug-in. In fact, if you want to import a high-quality image into Photoshop (some free image-editing software is not compatible with Photoshop), you may need to use Adobe Bridge to convert it to the image format that Photoshop uses. I describe this in more detail in the upcoming section "Converting Files." So much of a program's functionality depends on the number of layers in an image that you're starting to get confused. Here's a quick overview of some of the terms you may hear relating to layers and images. Layers: A picture is actually made up of a series of layers. I'm referring to the layers that create the finished image after all editing and effects have been applied. Layers represent the different color, tonal, and shading effects of an image, and they're used in editing, rendering, and even printing. You can make a separate layer for each different lighting or tonal value. The basic layer shown in Figure 11-1 is made up of five layers. They're shown in the order they appear in the layer list. Figure 11-1: Five layers make up the basic layer. Black-and-white images are made up of \_duotone\_ layers. A \_duotone\_ image has two or more transparent color layers that are applied to the layers beneath them. This method creates an image that's black and white. The area that's not covered with any transparent color becomes white. Typically, a duotone image has a light gray color in the areas not covered with any color on the image.

March 2017 Tuesday, March 14th, 2017 A wonderful time was had by all at the Boston Maritime Museum's first-ever Wind and Water Show this past Saturday and Sunday. This photo is from day two of the event. We were thrilled with the crowd turnout and the weather was a great companion to the event. The Museum's wind and water ship simulator was a big hit, and the museum's first-ever fountain was impressive to watch as well.Q: Can partial ordinals be presented in cyclic permutations? If  $\{\alpha_i\}_{i \in I}$  is a presentation of the partial ordinals, then it will be easy to prove that  $\alpha_i \leq \max\{\alpha_j \mid i \neq j\}$  for any  $i \in I$ . My question concerns presentations like the following:  $\{\alpha_i\}_{i \in \omega \setminus \{0\}}$  Does this satisfy the above statement? Is there a reason why this is not possible? A: First,  $\omega$  is a partial order with respect to the usual ordering relation. That is:  $\omega$
