Sunrise Designs, FL, has a proven record of quality and customer satisfaction in graphics and logos design. We provide high-quality, affordable, custom graphics design and installation in the Charlotte, North Carolina area. Contact us today to get started on your next project. solucionariohimmelblaudavidprincipiosbasicoscalculoseningenieriaquimicasextaedicion LASER-CORNER.Designer.Soccer.Scouting.Dribbble.PROSilverMoonbat.Bocce.Bars.The present invention relates to semiconductor devices and methods for fabricating the same. Recently, to meet the demand for higher densities of semiconductor devices, various measures have been taken to increase the integration degree of device elements. However, as the integration degree of device elements becomes higher, the size of each device element becomes smaller. If the area of each device element becomes smaller, the device isolation structure has to be miniaturized. Further, if the area of each device element is reduced, the thickness of the gate oxide layer needs to be reduced. However, in order to reduce the thickness of the gate oxide layer, the amount of impurities contained in the gate oxide layer has to be increased. For example, in a bulk silicon substrate, the thickness of the gate oxide layer is about 20 nm in a device region and about 100 nm in an element isolation region. On the other hand, in a silicon-on-insulator (SOI) substrate, the thickness of the gate oxide layer is about 1 nm in a device region and about 50 nm in an element isolation region. If the thickness of the gate oxide layer is reduced in the SOI substrate, the reliability of the device may be degraded. To prevent the degradation of device reliability, it is desirable that the thickness of the gate oxide layer should be reduced. Further, if the gate oxide layer is made to be thin in the SOI substrate, the reduction of the overall chip size of the device is limited. This is because the reduction of the element isolation region reduces the area in which a source region and a drain region are formed. As a result, the thickness of the source region and the drain region becomes thin, and thus the resistance of the source region and the drain region may be increased. Therefore, in the SOI substrate, the gate oxide layer has to be thick so as to prevent the formation of the source region and the drain region having
