The most familiar type of network is the basic network. It's the most well-known, but it is not the most useful or simplest. It is the most familiar because we've seen it everywhere. It has a beginning and an end and two nodes. It is typically defined by one or more route points. A route point is where the network is split into two directions. Using an example: Node A and B are connected by a Cable Network. A is connected to B with one cable. The cable goes to A's switch then to B's switch. B is also connected to node C. Node A and B are also connected to the Internet. Node A is connected to A by a LAN. Node A is also connected to node B by a WAN. Node A is connected to node C by a VPN. Node B is connected to node C by a LAN. Node B is also connected to node D by a WAN. Node C is connected to node D by a WAN. Each of those nodes is connected to multiple route points. But not all of them are connected to every node. What is a network? Networks can be wireless, cable, or any combination of those. Most networks have the Internet. It is called the Internet because it connects many computers. Why is it a network? A network is made of nodes and routes. The nodes are the computers, computers are the nodes, and the Internet is the route. A computer is a node. There are many computers on the Internet. They make up the nodes. The internet connects the nodes. That is the route. Some computers are connected to other computers through the Internet. That is a network. If a node is connected to the Internet then that node is connected to every computer on the Internet. If two nodes are connected to each other then they are connected to every computer on the Internet. A node can also be connected to a private network. The private network is private for a reason. The reason a computer can be connected to the Internet is because they are a node. Can't a node be a route? No. Nodes cannot be routes. If a node is a route it means that there is a network with two routes. The network cannot have only one route. If the Internet has only one route then the Internet has no nodes. Why is it
