literatureComparison of STM 50 and STM 50
Gen 5 to standard monovalent reagents in sperm

staining. In the past, monovalent reagents (MQ) were used in sperm staining on automated cytometers. MQ were easily re-programmed; however, with the advent of flow cytometry (FC), standard monovalent reagents (SM) and electronic staining (STM) have become the reagents of choice for sperm staining. Until recently, MQ were not available in a digital format for FC. Recently, two commercially available MQ have been converted to digital formats, including the single use STM 50 reagent and the STM 50 gen 5 reagent. The aim of this study was to compare the use of these new MQ reagents to the original MQ. Semen samples were used in this comparative study. One half of each sample was stained using the

new STM 50 reagents and one half of each sample was stained using the original MQ. Mean counts, positive cells, sperm morphology and percentage of forward-scatter bright cells were compared across the three staining methods. The data were analyzed using one-way analysis of variance 595f342e71
