The Adobe program is available free of charge as a download at `www.adobe.com/photoshop`. ## Exporting images Exporting your images is an essential step in completing an image-editing project. When an image is received in an email, the recipient wants to see a copy of it as soon as possible. This is usually done when an image is ready to be posted to a web page or placed in a newsletter. For this reason, I cover a very important topic in this chapter. Exporting is also important for other image-editing software because you need to save your project so that you can revert to the original if necessary. Exporting an image in Photoshop saves it to your hard drive in the form of a `.psd` file. When you open this file in another program such as Photoshop Elements or Lightroom, you can re-import the image into the application you use for final output. So a saved `.psd` file works as a sort of "universal" file that allows you to edit and save the final image at any time. You can choose to save your image in many different formats. Each format offers certain advantages and disadvantages. In Figure 13-1, you see a full-size image file (a contact sheet) and the file format in which it was exported. I created this image as a contact sheet; you can see the file type (PSD) that is the basis of the image on the right in Figure 13-1. The first step in this image is to crop the image to fit the matte. Because the matte surrounds the image, I don't need any of the underlying image to be included. **Figure 13-1:** Photoshop's Save as dialog box is used to export an image in a number of different formats. | --- | ---

Q: A must-have tool for visualising brain data for machine learning? I'm doing some research in the area of machine learning and brain function. I don't know of anyone who has built a tool like this yet. I'm looking for a tool that allows me to examine and visualize brain data in a way that is: Easy to use for a user without a computer science background. Directly importable from a brain atlas and/or other neuroimaging software packages. This would be extremely useful for me as I'm not a neuroanatomist. Free, preferably open-source. I've played around with Neurolion and also a lot of output from SPM and I do not see a clear winner. But, I'm concerned if SPM has all my needs covered? It has a large team of developers behind it, so it's a very capable tool. I'd like to avoid something that limits the possibility of adoption because I'm not a strong open-source advocate. A: Here is a small table that summarizes all open-source neuroscience/machine-learning software and what it does and what is currently the state of each of them: NeuroDebian (Very simple to use as it's easier to understand than other tools, but lacks most of the required features for the visualizations. It has also been the only tool in which I've seen real-time visualization in the past, but its developer discontinued development. FSL (The most popular neuroscience software and one of the most advanced software packages to date for science, with well-documented APIs. It has visualizations built in and a very large community, including the university that developed it. It is very advanced but out of the reach of a user without a background in computer science and mathematics. SIGNS (Has been developed by a very large community with a lot of infra-structure and, despite its name, is not limited to visualizations for epilepsy. It is very high-level and well documented. It has some visualizations, but the documentation is very limited for non-technical users. NeuroDebian had some visualizations that were very good. But I don
