Q: A simple question about the category of finite sets, the group of permutations and surjections. I have a very basic question that I am not able to settle, it is about finitely many objects and all morphisms between them: Let S and T be two finite sets. Consider the categories \mathbf{FinSet}^S and \mathbf{FinSet}^T where: - \mathbf{FinSet}^S consists of all finite sets with finite elements and homomorphisms between them. - \mathbf{FinSet}^T consists of all finite sets with finite elements and homomorphisms between them. I have two questions: Is $\text{Hom}_{\mathbf{FinSet}^S}(S, T) \cong \text{Hom}_{\mathbf{FinSet}^T}(S, T)$? If yes then is it easy to prove? So far what I did is that let us say that $\phi: S \rightarrow T$ and $g: S \rightarrow T$ are two morphisms. I know that for any two finitely many objects there is a bijection between the two. This is trivial when we have finitely many objects, but I am not sure if this also holds for the finitely many. Also I know that in any hom-set, the cardinality is always the same. I would really appreciate any help. A: With the little information you've given, yes. Given maps $f: X \rightarrow Y$ and

$g: X \rightarrow Z$, let $\tau: Y \rightarrow Z$ be the transposition map $y \mapsto y^T$. Then a straightforward argument shows that $\tau \circ f = g$. Likewise for the other direction. I'm guessing your question involves inverse maps, but the result is the same.

In the case of sets, a bijection is not enough to prove any equivalence. Given sets X and Y , an isomorphism between them is a map $\alpha: X \rightarrow Y$ such that both α and α^{-1} are bijections. Notice that this doesn't imply that $|X| = |Y|$ in general. It might help you to think about what it means for
