### What's New in the?

IVINIT, the utility offered to remove viruses from the MBR sector and/or hard drives that were configured with DOS, NTFS or certain other standard configuration tools/programs can be downloaded through the links below. It is completely free and once you have run it, you can be sure that your boot sector is clean and virus free, and that the next time you will run your system, it will boot clean without halting. IVINIT does not need any programming knowledge to work and even Windows 95/98/NT users can run it without having to use the DOS command Prompt. It will work under DOS just as well as it works under Windows or Windows NT. The best thing about IVINIT is that in its default configuration, it is complete and does not display any messages to the user. It only displays errors if it finds something or deletes something from your disk that it does not know how to, or is a problem with the disk partitions, and it does not show any of those errors, not even the real ones, as you would expect from a real virus remover. IVINIT is a powerful tool, and is basically a fully featured disk clean program. In addition to cleaning hard drive infections, it will also clean up almost any other disk or boot issues as well, such as bad sector remapping, boot record problems, DOS driver search problems, bad partitioning, bad disk geometry, bad FAT/NTFS hard drive structures etc. If you want to see what it will do, you can do so from the very first use of IVINIT, after you uninstall it, then run it, click the 'Show Disk Cleaner Information' button and look at the list of deleted files to see exactly what will be deleted, or even what it will find and remove from your disk. Note that if you run IVINIT, you may see a dialog box saying 'Cleaning completed successfully', or you may get an error, listing the error message you got. The error details will only show if you receive something that cannot be cleaned, such as virus removal, or if you were not able to run the program. These are usually reported as "Unspecified error", which means that there was an error while the program ran. IVINIT is not a replacement for your boot manager, it is not an antivirus program, nor does it have any of those features, nor does it work with any of those features, nor does it have
