A layer is the basic unit of data. When you open a new image, it's usually layered. When you open a raster (bitmap) image format, it usually is layered. As in all software programs, Photoshop organizes information in a hierarchical structure of folders and files. The layers are a container (folder) for other information within the image.

About a year ago, I became an old woman in the eyes of the world. I was given the honorable duty of advising the members of the Scottish Parliament on the issue of same sex marriage and came across a couple of things that struck me, as if my eyes were suddenly being opened to a truth that I'd always known but had been ignoring for years. Firstly, I came across two matters that explained the reason why my generation has been so vulnerable to the fundamentalist falsehood that marriage is between a man and a woman. This is not a generation that grew up with a strong feminist movement, nor have we gone through the kind of sexual revolution that many of my grandparents' generation went through. The way they had sex, the way they raised their children and the way they dealt with disagreements both in the home and in the world was a very different matter to our own lives. Having an abortion before there was even the slightest pressure to consider that this might be an option was hardly a daily or even a monthly issue in our generation. We came of age in a world where, if you had children, you knew that you could be "left behind" or that the person you were going to marry might die before you did and that you would still be the primary caregiver. The nuclear family was very clearly in place and the sanctity of this was held as a sacrosanct principle. Taken in the context of the other things that were happening in the world in our time, it's not difficult to see why the idea that marriage could ever be something other than between a man and a woman was something that was almost impossible for us to grasp. Secondly, this was a nation that had only just come through a very brutal and bloody Christian fundamentalist campaign to stop the practice of contraception and, especially, abortion. Like all those who live in the world of the dark ages, we thought only one thing would happen to us and that was that we would be put in the fiery furnace forever and our bones would be ground to dust and we would die screaming for mercy. We didn't realise that we could do anything to affect our own lives. It would be absurd to think that we would ever have considered that we could opt not to have children. So, when we realised that a woman could take an abortion pill and go home and get on with her life, it seemed a very foreign and

## What's New in the?

1. Field of the Invention The present invention relates to a method of chemical vapor depositing metal or metal oxide films onto substrates and more specifically to a method of chemical vapor depositing films on silicon. 2. Description of the Prior Art The invention and its background are particularly applicable to the chemical vapor deposition of a thermal barrier coating onto a surface of a substrate such as a silicon wafer. It is well known in the art of semiconductor processing that as integrated circuits are scaled down to smaller dimensions, performance deteriorates due to the higher density of the semiconductor device, higher doping, thinner gate oxide layers and other factors. There are several technical solutions to deal with this problem. One technical solution involves adding processing steps and using additional materials to compensate for the decreased performance of the semiconductor device. For example, the physical dimension of transistor gate lengths has been decreased by the use of the "gate last" or "replacement gate" process. In this process, a dummy gate material is initially deposited over a substrate and subsequently removed to provide an opening over a source/drain area of the substrate. A transistor gate conductor is then deposited within the opening to replace the removed dummy gate material. This process provides better control of gate length, making the gate conductor of the device more precisely defined. Thus, the transistor gate conductor is often fabricated to be as thin as possible while still providing performance adequate for the desired device. With this "gate last" process, a high performance dielectric, such as HfO<sub>2</sub>, is then formed over the semiconductor substrate to fill the opening of the gate conductor. Unfortunately, this high performance dielectric requires a relatively thick layer of over 2,000 Angstroms in order to reduce gate leakage current. The thermal budget of the fabrication process must be sufficient to accommodate this relatively thick dielectric. In view of this, new processes are being developed to substitute HfO<sub>2</sub> with a thermal barrier material that can be formed as a high performance dielectric. Such a thermal barrier material typically has a thermal conductivity of at least approximately 25 W/cm-K. One approach for depositing such a thermal barrier layer onto the surface of a substrate is by chemical vapor deposition. However, the thermal barrier layer is conventionally deposited onto a substrate by CVD at high temperatures of 800° C. and greater. Unfortunately, at these high temperatures, chemical vapor deposition of these thermal barrier layers does not produce stable, high quality thin
