Scarface.Discography.@.320..14.Album Check out the latest music videos from Scarface.Slow real-time compression may not be best choice for HD streaming I've been spending a lot of time lately talking to subscribers about slower compression. In particular, the traffic that video broadcasters have to deal with is dramatically higher than the traffic they do when standard definition streaming is the only option (hence the popularity of Blu-Ray these days). How do they do it? Well, slow compression is usually fine for HD streaming, because the video quality is very good. However, with standard definition streaming, the quality is quite poor. So why slow compression? Because it can make that quality look better by reducing the amount of data sent over the network. The more data you send in each second, the less of a difference it looks. HD quality video looks beautiful, and SD quality video looks horrible. Slowing down your stream by 25-40% makes it look like someone just installed a high-end graphics card to your streaming video client. Video quality is such a huge selling point for me that I won't stop streaming on my network until all my users have an up-to-date video client that supports slow compression. And when I say "all my users," I really mean "all the users on my network." I'll include UPNP clients in my list even though I don't think those work very well. So the question is, is slowing down the rate of data transfer enough to be noticeable by the average subscriber? Fortunately, the data transfer has been the limiting factor in my tests thus far. I'll let the science speak for itself in these screens. The data transfer bar comes from my NVIDIA GeForce 420M, which is quite capable. The "speed" bar comes from my laptop, an Asus EEE PC, which is very, very slow. First up, the standard definition test. You
