Q: How to fix "The integration contains an integral which is not absolutely convergent" error? Here is a simple code to compute the integral F[u_, v_] = E^-(v - u) Integrate[E^(u - v), {v, Infinity}]; Then I get the error: The integration contains an integral which is not absolutely convergent. After some research, I know that the integral will be divergent if I set $v = \infty$. But how to fix it? A: You may always add an auxiliary variable to an integral and calculate the ratio of the values of the integral in the limits of the auxiliary variable in the integral's nominator and denominator. For example here: f[u_, v_] = E^- (v - u) Integrate[E^(u - v), {v, Infinity}] g[u_, v_] = E^- (v - u) Integrate[E^(u - v), {v, 0}] (f[u, Infinity] / g[u, 0]) // Simplify becomes $\frac{1}{2} \left(\text{E}(-u)+\text{E}(u)\right)$ A: If you wish to keep it in absolute integrals form, you can use the function NIntegrate. F[u_, v_] = NIntegrate[E^(-v - u) E^(u - v), {v, Infinity}] gives the same result. NIntegrate[E^(-v - u) E^(u - v), {v, 0, Infty}] gives the same result. If you just want a numerical approximation, you can always use NumericQ to exclude Infinity and other values which are not allowed with NIntegrate: NIntegrate[E^(-v - u) E^(u - v), {v, {0, Infinity}}] For people who have impacted your life When life goes sour Thank you for your plans and dreams.They mean so much to me, even when I wasn't ready to act on them. $$\begin{aligned})\mathrm{d}z\right)\\ &=f(x)e^{(r-\delta^2)t}\left(\int_{\mathbb{R}}e^{ -\delta z}p(z)\mathrm{d}z\right)\mathrm{d}t\\ &\qquad+\delta e^{(r-\delta^2)t}\left(\int_{\mathbb{R}}e^{ -\delta z}p(z)\mathrm{d}z\right)\mathrm{d}t\\ &=f(x)e^{(r-\delta^2)t}\left(\int_{\mathbb{R}}e^{ -\delta z}p(z)\mathrm{d}z\right)\mathrm{d}t.\end{aligned}$$ The answer is now proven. Conclusion ========== If the origin is a local minimum of $\mathcal{L}_\delta$ with respect to small δ, then Theorem \[suff\] provides conditions for long time behavior of the stock price in this case. If the origin is a local maximum, the situation is similar. In the case of a global minimum, it is more difficult to describe the long time behavior of the stock price for large δ, due to the involvement of the effects of the boundary conditions. Yet, it is possible to comment on the case of a global maximum, in which it is also noted that the optimal strategy has no boundary adjustment. In the case when the stochastic differential equation is degenerate elliptic, i.e. s^2 is a constant, Theorem \[switch\] describes the behavior of the optimal policy when $r>s^2/2$ and $r
